

How Stritt & Priebe Repairs Your Valve

When your valve enters our facility, it is completely disassembled and blasted for inspection.

Repairable valves then have internal components machined & lapped to manufacturers' specifications. Along with internal rework, bonnet gasket and flange gasket surfaces are inspected and resurfaced if required.

Valves are then reassembled and tested to industry standards.

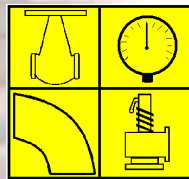

If for any reason our technicians deem a valve not repairable, one of our knowledgeable sales staff will assist you with replacing your valve with the proper product for your application.

We serve all national and international customers with excellence & efficiency. Contact us today to speak with any of our qualified sales staff so we can begin to meet all your industrial PVF needs. Visit our great interactive website at www.strittandpriebe.com and see the many ways we can help you!
